"Structural evidence for independent joining region gene in

"structural evidence for independent joining region gene in

"mamnoglobulin heavy chains from anti-galactan myeloma proteins and

its potential role in generating diversity in

complementarity-determining regions.";

Proc. Natl. Acad. Sci. U.S.A. 76:2890-2894 (1979).

-! MISCELLANEOUS: THIS CHAIN WAS ISOLATED FROM AN IGA MYELOMA PROTEIN

THAT BINDS GALACTAN.

-! SIMILARITY: Contains 1 immunoglobulin-like domain.

```
monoclonal antibody (MAD) which is immunoreactive with HIV glycoprotein gp120 and is capable of neutralising HIV. This sequence contains the leader sequence derived from the mouse B72.3 heavy chain, and the human VH consensus sequence attached to the N-terminal of the b12 VH sequence. The DNA sequence contains a Kozak sequence for the control of VH expression. This sequence was amplified using the primer sequences given in AAT40889-92. A MAD containing this VH sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 for a concentration of less than 700 ng of antibody/ml, and binds mature determining immunocompetence of a human anti-HIV antibody and in the determining immunocompetence of a human anti-HIV antibody and in the determining immunocompetence of a human anti-HIV antibody and in the
                                                                                                                                                                                                                                                    Heavy chain; light chain; variable region; VH; monoclonal antibody; MAb; HIV; human immunodeficiency virus; glycoprotein; gpl20; clone; virus infectivity assay; precursor gpl60; immunocompetence; human; anti-HIV antibody; detection; HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monoclonal antibody binding to VI/V2 loop of HIV gp120 - used in passive immuno:therapy and detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 represents the heavy chain variable region (VH) of a

This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human immunodeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in virto virus infectivity assay by 50% at a concentration of less than 70 ng/ml. The method for the production of the antibody comprises: (a) providing a first production of the antibody comprises: (a) providing a first polynuclectide encoding a heavy chain immunoglobulin amino acid sequence (which does not comprise the sequence represented by AAV98206) and a sequence; (b) inserting the first and second polynuclectide sequences into a host cell; (c) maintaining the host cell in conditions which allow the antibod sequences encoded by the polynuclectides to be expressed in the host cell; and (d) isolating the antibody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell. The antibody capable is the cell in the host cell; and (d) isolating the antibody comprising the heavy and immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease and the patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV

in a biological fluid or tissue sample e.g. by radioimmunoassay, for producing anti-idiotypic antibodies which can be used for active hypodening anti-idiotypic antibodies which can be used for active with the same and to screen human monoclonal artibodies to identify those with the same binding specificity and to monitor the course of HIV disease therapy by measuring the changes in concentration of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 monoclonal antibodies are encoded by a human polymucleotide sequence and when used in vivo for diagnosis and immunotherapy of HIV induced disease reduce the problems of significant host immune response to the antibodies associated with monoclonal antibodies of xenogeneic or chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

The invention relates to a human whole immunoglobulin (Ig) molecule which immunoraects with HIV mature glycoprocein gp120 preferentially over HIV precursor glycoprotein gp120 preferentially over HIV infectivity titre in an in vitro virus infectivity as as a concentration of less than 700 ng/ml. The antibodies are used as reagents for the diagnosis and
